## **CHAPTER 1. APIS**

You can access APIs to create and manage application resources, channels, subscriptions, and to query information.

**User required access:** You can only perform actions that your role is assigned. Learn about access requirements from the Role-based access control documentation.

For more information, review the API documentation for each of the following resources:

- Clusters API
- ClusterSets API (v1beta1)
- ClusterSetBindings API (v1beta1)
- Channels API
- Subscriptions API
- PlacementRules API
- Applications API
- Helm API
- Policy API
- Observability API
- Search customization API
- MultiClusterHub API
- Placements API (v1alpha1)
- PlacementDecisions API (v1alpha1)
- DiscoveryConfig API
- DiscoveredCluster API

## 1.13.3.1. Multicluster hub operator

Name	Description	Schema
apiVersion required	The versioned schema of the MultiClusterHub.	string
kind required	String value that represents the REST resource.	string
metadata required	Describes rules that define the resource.	object
spec required	The resource specification.	spec

## spec

availabilityConfig optional	Specifies deployment replication for improved availability. The default value is <b>High</b> .	string
customCAConfigma p optional	Provide the customized OpenShift default ingress CA certificate to Red Hat Advanced Cluster Management.	string
disableHubSelfMan agement optional	Disable automatic import of the hub cluster as a managed cluster.	boolean
disableUpdateClust erImageSets optional	Disable automatic update of ClusterImageSets.	boolean

availabilityConfig optional	Specifies deployment replication for improved availability. The default value is <b>High</b> .	string
hive optional	(Deprecated) An object that overrides for the default HiveConfig specification.	hive
imagePullSecret optional	Overrides pull secret for accessing MultiClusterHub operand and endpoint images.	string
ingress optional	Configuration options for ingress management.	ingress
nodeSelector optional	Set the node selectors.	string
separateCertificate Management optional	(Deprecated) Install <b>cert-</b> <b>manager</b> into its own namespace.	boolean

## hive

additionalCertificat eAuthorities optional	(Deprecated) A list of references to secrets in the hive namespace that contain an additional Certificate Authority to use when communicating with target clusters. These certificate authorities are used in addition to any self-signed CA generated by each cluster on installation.	object
backup optional	(Deprecated) Specifies the configuration for backup integration. If absent, backup integration is disabled.	backup
externalDNS optional	(Deprecated) Specifies configuration for <b>external-dns</b> if it is to be deployed by Hive. If absent, <b>external-dns</b> is not be deployed.	object
failedProvisionConfi g required	(Deprecated) Used to configure settings related to handling provision failures.	failedProvisionConfig

additionalCertificat eAuthorities optional	(Deprecated) A list of references to secrets in the hive namespace that contain an additional Certificate Authority to use when communicating with target clusters. These certificate authorities are used in addition to any self-signed CA generated by each cluster on installation.	object
globalPullSecret optional	(Deprecated) Used to specify a pull secret that is used globally by all of the cluster deployments. For each cluster deployment, the contents of <b>globalPullSecret</b> are merged with the specific pull secret for a cluster deployment (if specified), with precedence given to the contents of the pull secret for the cluster deployment.	object
maintenanceMode optional	(Deprecated) Can be set to true to disable the hive controllers in situations where you need to ensure nothing is running that adds or acts upon finalizers on Hive types. This should rarely be needed. Sets replicas to <b>0</b> for the <b>hive-controllers</b> deployment to accomplish this.	boolean

## ingress

full list of supported ciphers.	sslCiphers optional	List of SSL ciphers enabled for management ingress. Defaults to full list of supported ciphers.	string
---------------------------------	------------------------	---	--------

# backup

minBackupPeriodSe conds optional	(Deprecated) Specifies that a minimum of MinBackupPeriodSeconds occurs in between each backup. This is used to rate limit backups. This potentially batches together multiple changes into one backup. No backups are lost as changes happen during this interval are queued up and result in a backup happening once the interval has been completed.	integer
velero optional	(Deprecated) Velero specifies configuration for the Velero backup integration.	object

# ${\sf failedProvisionConfig}$

skipGatherLogs	(Deprecated) Disables	boolean
optional	functionality that attempts to gather full logs from the cluster	
	if an installation fails for any	
	reason. The logs are stored in a	
	persistent volume for up to	
	seven days.	

#### status

components optional	The components of the status configuration.	object
conditions optional	Contains the different conditions for the multicluster hub.	conditions
desiredVersion optional	Indicates the desired version.	string
phase optional	Represents the active phase of the MultiClusterHub resource. The values that are used for this parameter are: <b>Pending</b> , <b>Running</b> , <b>Installing</b> , <b>Updating</b> , <b>Uninstalling</b>	string

## conditions

lastTransitionTime optional	The last time the condition changed from one status to another.	string
lastUpdateTime optional	The last time this condition was updated.	string
message required	Message is a human-readable message indicating details about the last status change.	string
reason required	A brief reason for why the condition status changed.	string
status required	The status of the condition.	string
<b>type</b> required	The type of the cluster condition.	string

## StatusConditions

kind required	The resource <b>kind</b> that represents this status.	string
available required	Indicates whether this component is properly running.	boolean
lastTransitionTime optional	The last time the condition changed from one status to another.	metav1.time
lastUpdateTime optional	The last time this condition was updated.	metav1.time
message required	Message is a human-readable message indicating details about the last status change.	string
reason optional	A brief reason for why the condition status changed.	string
status optional	The status of the condition.	string
<b>type</b> optional	The type of the cluster condition.	string

"description": "ObjectReference contains enough information to let you inspect or modify the referred object. --- New uses of this type are discouraged because of difficulty describing its usage when embedded in APIs. 1. Ignored fields. It includes many fields which are not generally honored. For instance, ResourceVersion and FieldPath are both very rarely valid in actual usage. 2. Invalid usage help. It is impossible to add specific help for individual usage. In most embedded usages, there are particular restrictions like, \"must refer only to types A and B\" or \"UID not honored\" or \"name must be restricted\". Those cannot be well described when embedded. 3. Inconsistent validation. Because the usages are different, the validation rules are different by usage, which makes it hard for users to predict what will happen. 4. The fields are both imprecise and overly precise. Kind is not a precise mapping to a URL. This can produce ambiguity during interpretation and require a REST mapping. In most cases, the dependency is on the group, resource tuple the version of the actual struct is irrelevant. 5. We cannot easily change it. Because this type is embedded in many locations, updates to this type will affect numerous schemas. Don't make new APIs embed an underspecified API type they do not control. Instead of using this type, create a locally provided and used type that is well-focused on your reference. For example, ServiceReferences for admission registration: https://github.com/kubernetes/api/blob/release-

1.17/admissionregistration/v1/types.go#L533 .",

For example, if the object reference is to a container within a pod, this would take on a value like: \"spec.containers{name}\" (where \"name\" refers to the name of the container that triggered the event) or if no container name is specified \"spec.containers[2]\" (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object. TODO: this design is not final and this field is subject to change in the future.",
